DP32 ordinary-sigma table screen

RunPod · NVIDIA RTX PRO 6000 Blackwell Server Edition · 20261012T1815Z

Decision

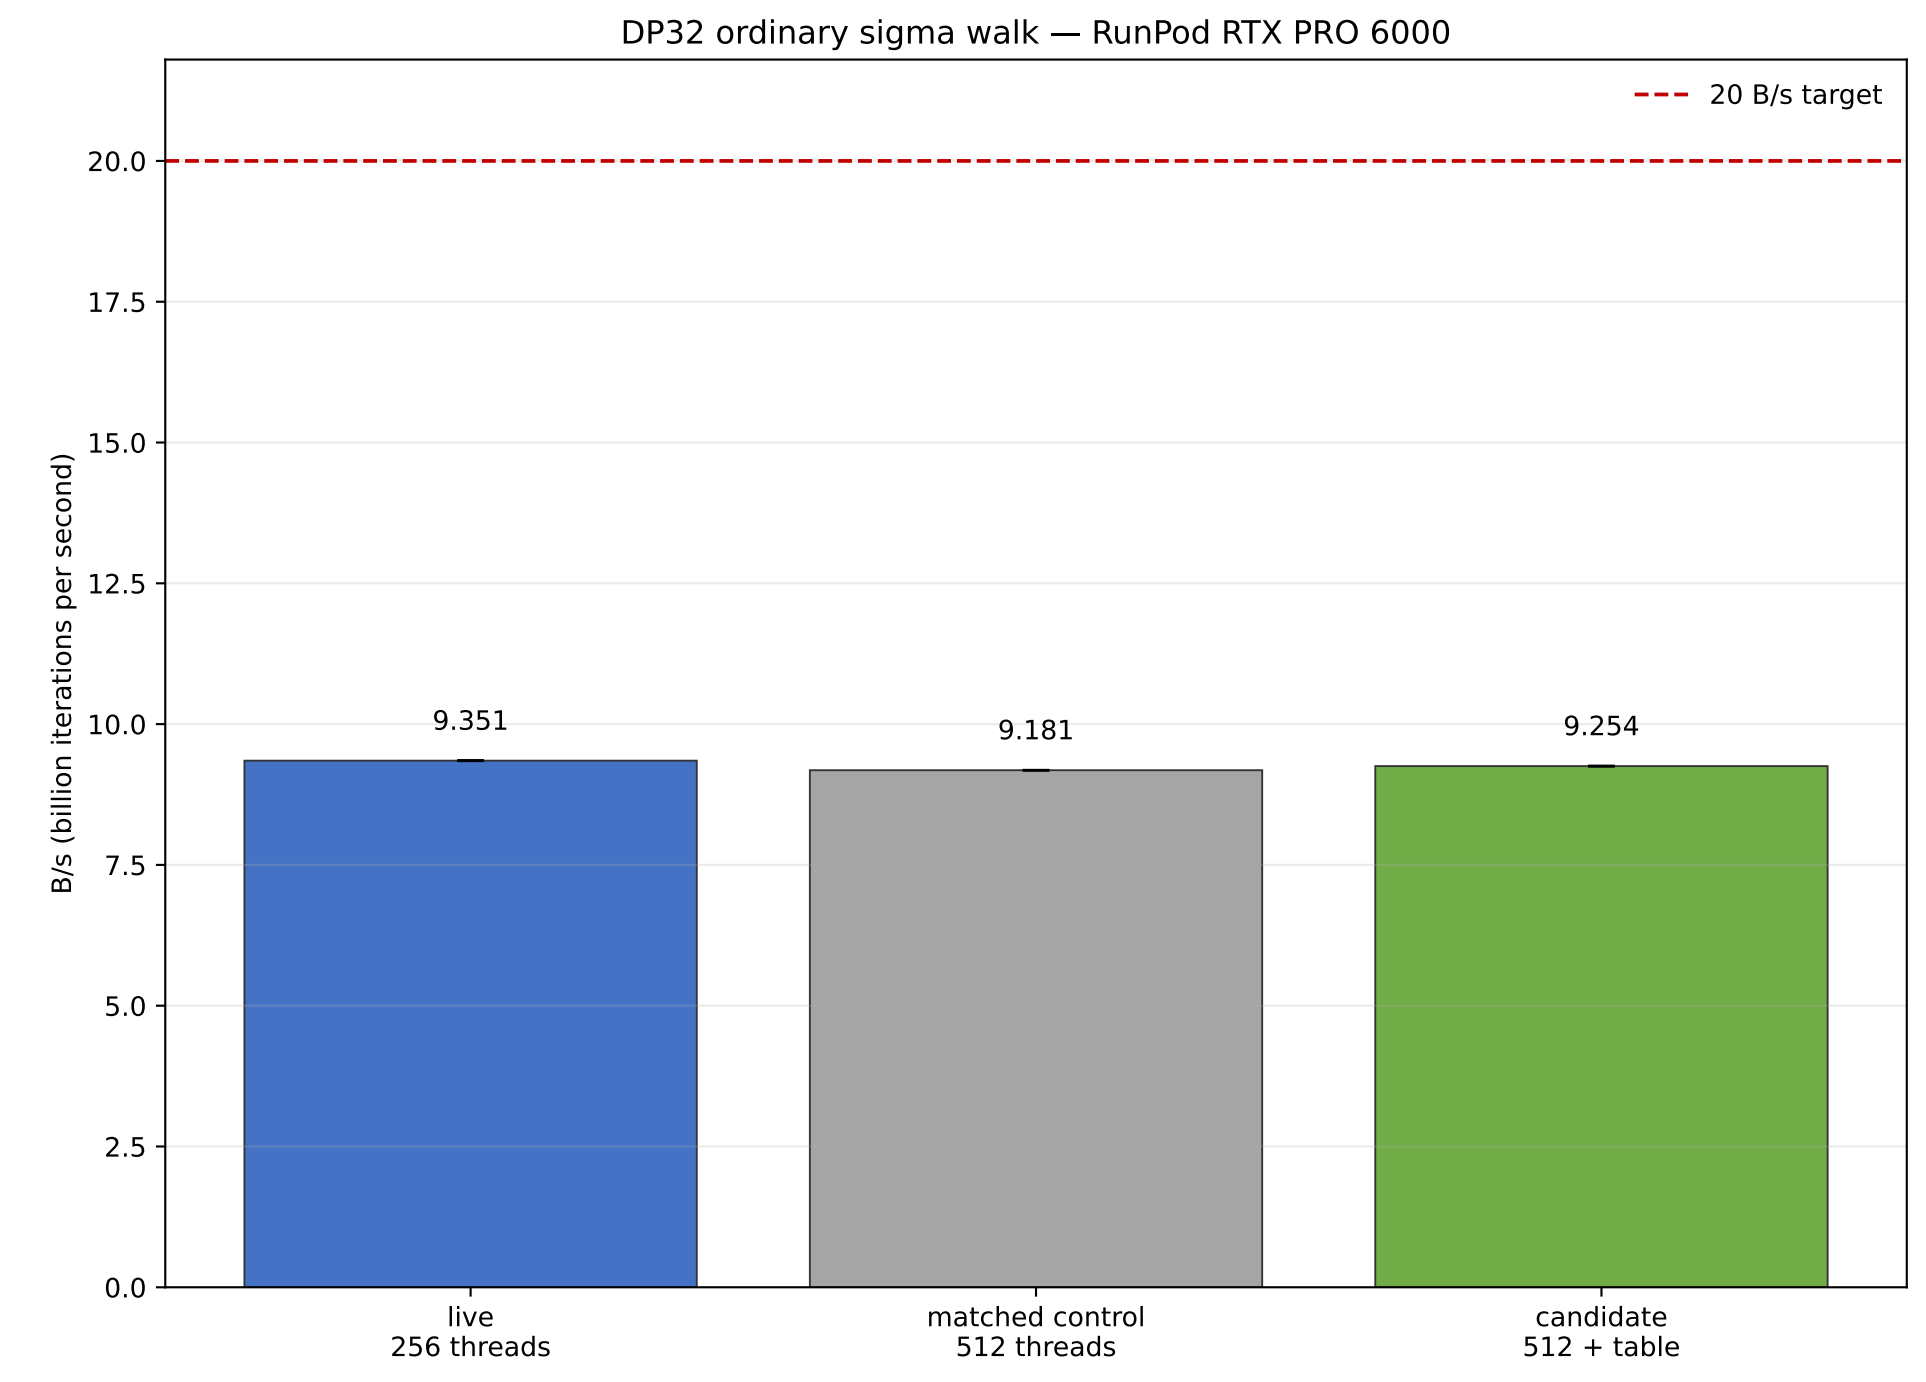
The exact polynomial-coordinate sigma table passed the DP32 correctness screen, but did not reach 20 B/s or beat the live geometry on this card. Candidate: 9.254351 B/s (+0.7947% vs matched 512-thread control; -1.0330% vs live 256-thread geometry).

Arm	Median B/s	Range B/s	Table
live / 256 threads	9.350950	9.348547–9.354615	off
control / 512 threads	9.181391	9.179768–9.181455	off
candidate / 512 threads	9.254351	9.252145–9.255851	on

Correctness receipt

- CUDA arithmetic suite passed for all arms
- 5/5 DP32 points reference-verified per arm; 0 dropped
- sorted v2 corpora identical across live, control, and candidate
- candidate: 126 registers/thread, 68,352 dynamic shared bytes, one block/SM
- this is a screen, not full campaign qualification; production was unchanged

Source: source-files.sha256 and raw/run11; prior 300-report timeout is in raw/failed-run9.



Whiskers show the three recorded A/B samples; dashed line is the requested 20 B/s target.
