# Run record: S3 and seven-arm held-out panel

**Date:** 2026-10-16. **Host:** Darwin arm64 shared L0. **Revision:** `codex/isogeny-portable-trend-20261015`. The frozen V2/V3 specs record exact solver, checker, meter, script, public and private input SHA-256 values.

**Hypothesis:** source and quotient S3 pair support matches direct enumeration, and their complete per-target implementation cost may differ. Any exhaustive mismatch stops the panel.

**Exhaustive commands:** run `different_j_chi_resultant exhaustive-s3` on `FOUR_TARGET_PUBLIC_V1.json`, then independently run `different_j_chi_resultant_check check-s3` on its 229 case rows. Both returned exit status zero. Each curve had 136 pairs and 130 zero-pair cases.

**Panel commands:** `bash RUN_HELDOUT_SEVEN_ARM_V3.sh` created 84 separate child records and meter records. The independent `different_j_chi_heldout_check` replayed both curves, 664 relation witnesses, row ranks, BSGS and rho. The native summary read all child records. All 84 children passed.

**Limits:** 300-second hard wall timeout per child; peak RSS checked against 512 MiB after completion. Darwin rejected address-space and data-size hard memory limits in the earlier V2 checks. This host has no isolation or thermal receipt. Complete portable S, L2 admitted wall time, direct inverse-Vélu and full-image relation controls remain open.

See `HELDOUT_RESULTS_V3.md`, `HELDOUT_SEVEN_ARM_V3.summary.json`, `HELDOUT_SEVEN_ARM_V3.check.json`, `S3_EXHAUSTIVE_V2.check.json`, the raw directory and the hash manifest.
