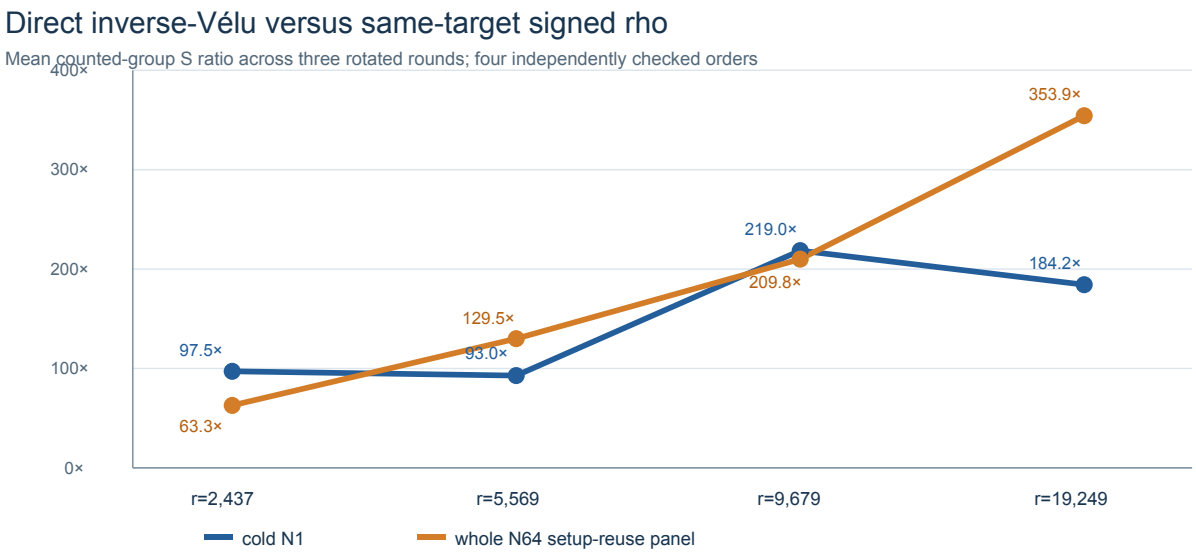
Run receipt: four-order direct inverse trend

Run ID: `inverse_velu/trend_four_cell_v1/darwin_v1`



The four independently checked subgroup orders are 2,437, 5,569, 9,679 and 19,249. At each, four arms ran at N1 and N64 in three rotated rounds. All 96 child processes completed. The independent checker replayed 3,120 scalars, 9,565 relation witnesses and the trial streams. The figure shows the inverse/rho counted-group S ratio, with N1 and whole N64 separated. Full-image, complete portable primitive cost and isolated wall remain open. Raw paths, hashes and source versions are in the run spec and report.
