

Isogeny setup and hashing continuation

Matched 349-model inputs; Rust 1.93.1; portable release flags; native ARM Linux under the local Docker VM.

Five interleaved rounds. Callgrind Ir is summed across parent and constructor child. Native macOS throughput is unmeasured.

screen-p224: reference 79775288 instructions; candidate 25560912; ratio 3.120988; reduction 67.958860%.

verify-p224: reference 47034207645 instructions; candidate 46964692849; ratio 1.001480; reduction 0.147796%.

search-p192: reference 12537519198 instructions; candidate 11873982047; ratio 1.055882; reduction 5.292412%.

Preregistered full-search acceptance: PASS. The threshold is at least 1% fewer complete-command instructions.

Catalogue JSON, candidate records, independent certificates and full-search map bytes match in every round. No exact mathematical check was removed.

Receipt hashes are checked against the unchanged SHA-256 implementation. Runtime CPU detection preserves a portable fallback. The compact index retains exact curve/subgroup inputs.

Inventory and support remain 349 models, 174 prime construction models and 146 replay models. Montgomery/Edwards, binary and extension map adapters remain open.

Root compilation retains 643 errors; hosted CI, merge and ReleaseMe publication remain pending. No new map changes canonical graphs or the IC performance ledger.

An external Docker interruption has an empty counter. Its work is unmeasured and preserved separately. Medians describe completed commands; no campaign-total gain is claimed.

Receipts: PROTOCOL.md, PROFILE_SUMMARY.json, MANIFEST.json, INTERRUPTION.json, validation logs and compact raw evidence archives. The next page contains the editable vector diagram.

Native isogeny command setup and receipt hashing

349-model matched inputs | 5 interleaved rounds | ARM Linux Callgrind Ir

Executed instructions relative to each command's matched reference

Complete-search acceptance: PASS. Exact output comparisons: PASS.

Catalogue adapters, root compilation, hosted CI and publication gaps remain explicit.
