Changed hard search and exact source-symmetry preparation

The changed limit2 norm-primary search was inconclusive. Zero verified witnesses were found; the exact norm and original-root counts remain null. The native solver returned UNKNOWN. This refutes the bounded prediction of a witness or native exhaustion within60seconds; it proves neither emptiness nor impossibility.

The actual GF(2^83),d18 circuit retained174 primary bits,40148 declared and45427 internal coordinates. Gaussian reasoning was active with1 initialized matrix, peak9169 rows and22491 columns,0 row/column cap rejections. It recorded7167 conflicts,12065 primary decisions and28207875 Gaussian row-XOR operations. Native inner time was61.510seconds, exceeding its requested60-second budget; no exact result was accepted. The supervising cold process ended in61.794seconds,385368KiB peak RSS, within90seconds/4GiB/CPU0. These are development diagnostics, without qualified isolation or a matching comparison. No speed ratio follows from the old timeout or the smaller representation.

The search driver passed six complete independent literal-norm model-set controls over GF4/GF8, a0/a1 and both target signs. It replayed all declared functional coordinates. Cap1 and expired-budget tests kept exact counts null. Source/input/binary/dependency hashes and budgets were frozen before the hard run. Original S3 ghosts, exceptional maps and auxiliary fibers remain unresolved; no independently checked large UNSAT certificate is produced.

Additional preparation tested the exact S5 norm-source symmetry with identical source domains.34816 literal assignments across8 tiny cases gave exact full-set equality after sorting and UNIQUE permutation restoration. Six cases had28 ordered norm-primary roots and6 sorted representatives; two had168 ordered roots and15 representatives. Repeated sources produce orbit sizes1,5,10 or30 in these cases, so dividing counts uniformly by120 is invalid. This is a preparation oracle, not a native ordered-comparator test, hard solve or speed comparison. The symmetry proof does not automatically apply to arbitrary systems or original S3 auxiliary tuples.

Next: add exact nondecreasing-source comparators in a fresh compiler, verify complete sorted native model sets and restored ordered sets, then preregister a changed hard search. Separately test the exact three-source-to-torsion reduction in TORSION_PREFIX_NEXT.md; its linear rank and candidate search size remain unmeasured. Do not retry this same timeout unchanged. Broad prime/extension-field all-roots coverage, novelty and the full matching genuine F4/F5/F6 eightfold end-to-end gate remain open.

Source code is committed in PR2049. New reports remain local under the existing separate publication-authorization question; no alternative export route is used. Canonical performance graphs remain unchanged because no qualified performance result was established.
