Eigen-Séta v2 L1 round-trip record

Run `run-20261011T1944Z-l1-fix`, protocol frozen 2026-10-11 19:44 UTC. Source: repository commit `cd47963f9` imported into base `7f7672d01`, with the local constant-time scalar-recovery edge-case correction. This run does not cover the subsequent public-input validation edit.

Command from `eigen_seta/`: `cargo run --release --example run -- L1 1`. Rust 1.99.0, release build, AMD EPYC 7763 shared cloud VM (x86-64, five logical CPUs). No core pinning, isolation, or frequency control. `OsRng` seed not captured. Requested: one key, one encapsulation and decapsulation; completed: one each. Exit 0, shared keys equal; no failures.

KeyGen (s)	Encaps (s)	Decaps (s)
25.788	0.2242	11.406

Each value is a measured wall-clock sample (n=1); no spread or uncertainty interval was recorded. Public key and ciphertext: 1344 bytes each. Sampled secret degree: 278 bits. Source data and exact output: `records/run_output.txt`.

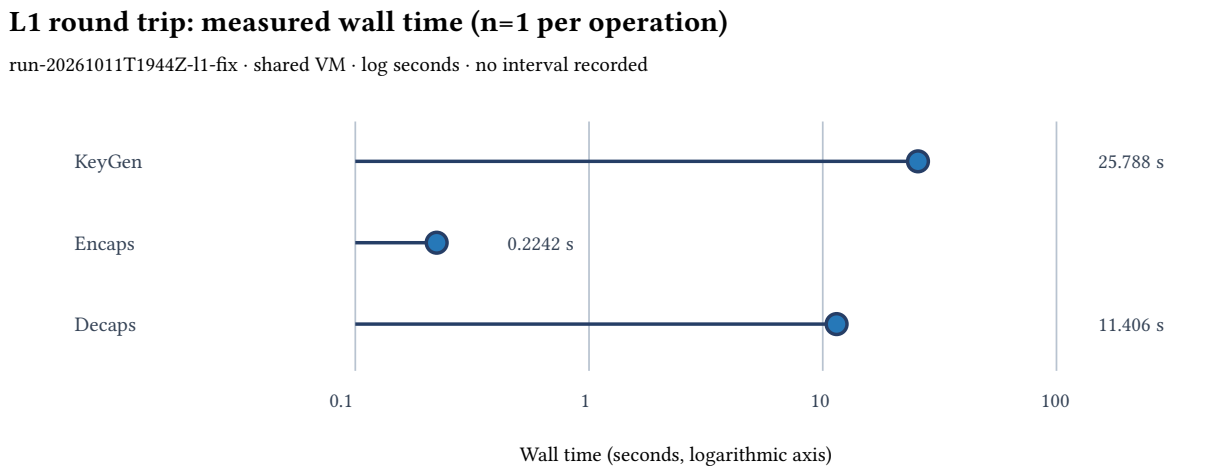

Figure 1: Wall times, one sample per operation; log seconds. Run run-20261011T1944Z-l1-fix.

The result is a functional round trip, not a security claim, timing bound, or constant-time validation. Historical runs in the study benchmark report were performed on another host and are not pooled with this sample.
