Four-bin direct inverse-Vélu order screen

2026-10-16 · bounded structural input selection

The frozen native screen examined 513 eligible base primes in the range 1238 through 10007. Its independent Rust checker recalculated all rows and replayed 5,440 sampled map identities. It found first eligible cells at subgroup orders 2,437, 5,569, and 9,679. The fourth bin had no eligible cell in this bounded prime range.

The three selected cells are structural inputs. Exact subgroup targets, complete relation recovery, portable price, and isolated performance remain separate gates. The fourth bin needs a separately frozen range extension. No canonical ECDLP frontier row changes from this screen.

Evidence: `FOUR_GATE_PROTOCOL_V1.md`, `SCREEN_FREEZE_V1.json`, `SCREEN_V1.jsonl`, `SCREEN_V1.check.json`, and `SCREEN_REPORT_V1.md`. The raw JSONL SHA-256 is `ef232a54b22938239819fd6b14182d1e49de5778e9c00542ce257c54097608a5`.
