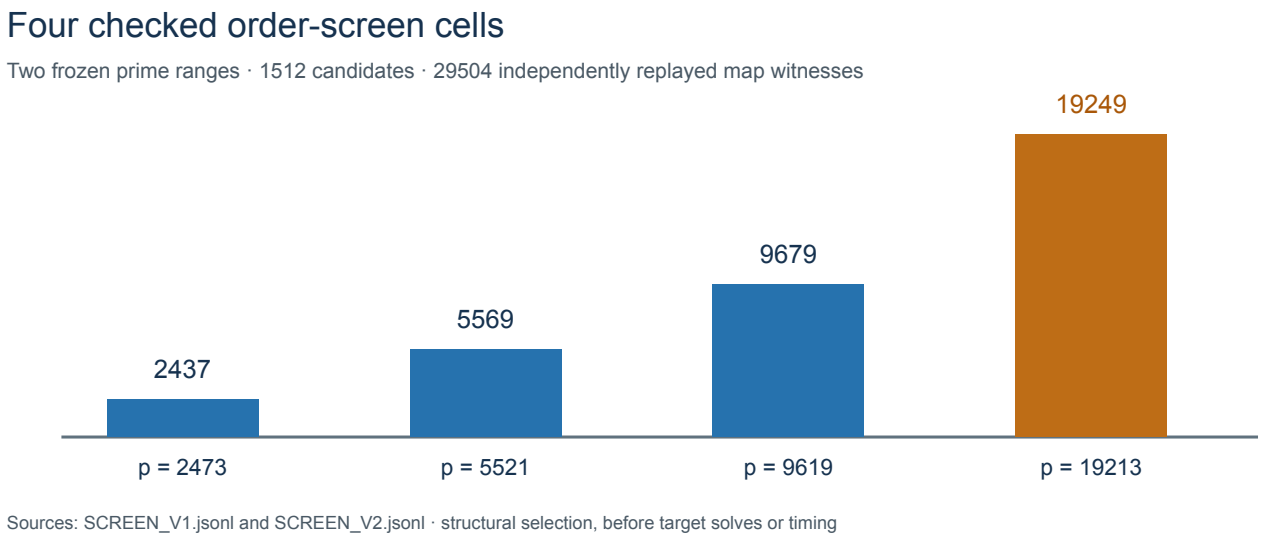
Fourth order-bin range extension

2026-10-16 · checked structural input selection

V2 examined 999 additional eligible base primes from 10009 through 30011. Its independent Rust checker replayed 24,064 sampled map identities. The first fourth-bin cell is p = 19213, r = 19249, with cofactor 19179. Combined with V1, four spaced subgroup orders are selected.



All four cells still need exact subgroup and fiber audits, frozen new targets, N1 and N64 complete relation solves, scalar replay, primitive pricing and isolated timing. The screen cannot establish a cost trend.

Evidence: `SCREEN_RANGE_EXTENSION_V2.md`, `SCREEN_FREEZE_V2.json`, `SCREEN_V2.jsonl`, `SCREEN_V2.check.json`, `SCREEN_REPORT_V2.md`. The V2 raw SHA-256 is `71c1926fee540df9566537ae60b063fc276f93b6b6d6c5f24ce8d69225305afa`.
