Three complete ordinary isogeny classes

Additional 57/59-bit examples; run 20261017. Original A/C/D/E remain incomplete.

Source model	Vertices	Directed maps	Strata
icv1-fp57-t536870914-6cabb0c9	8,192	16,384	14
icv1-fp57-tm536870941-e6d0c766	6,561	13,122	9

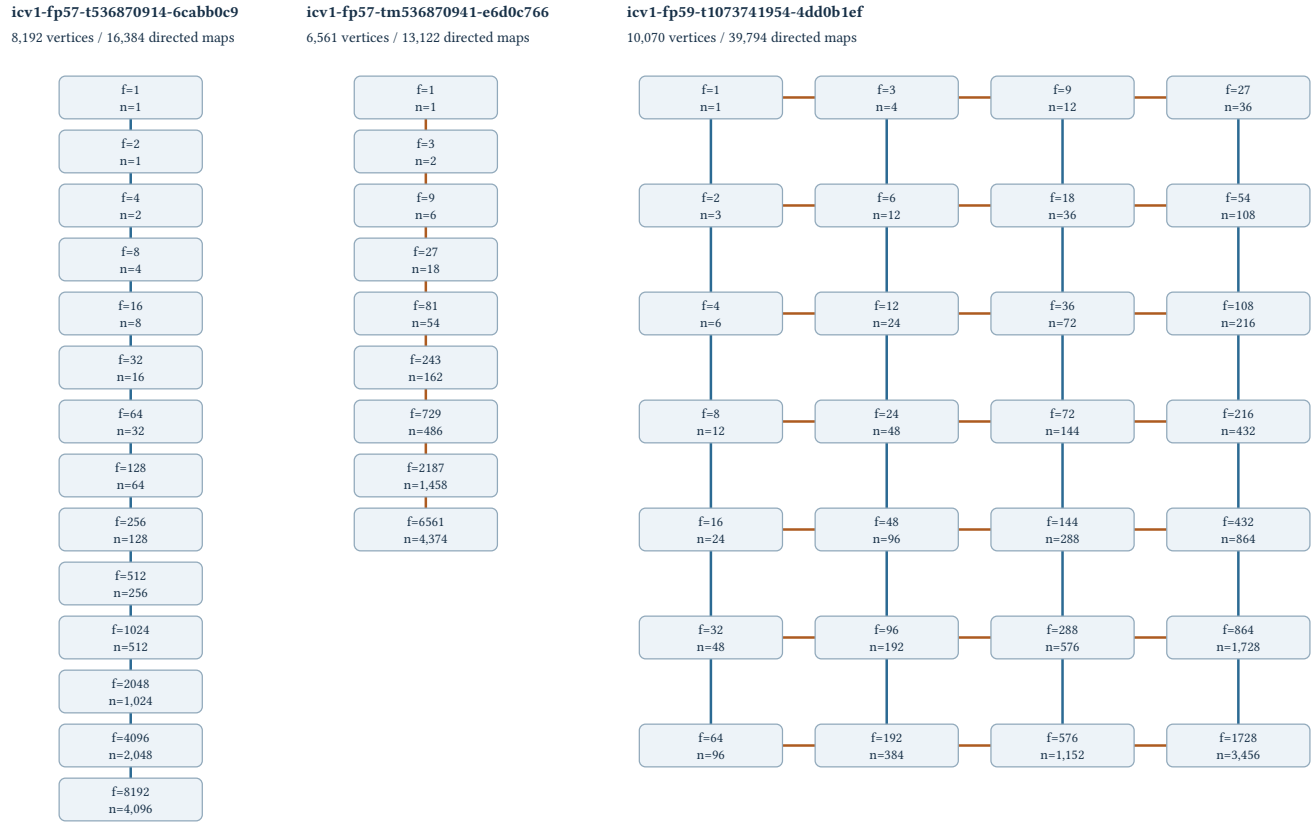
Complete conductor-stratum coverage

Each box aggregates one endomorphism conductor; labels are conductor f and exact vertex population n.



Blue: degree 2. Orange: degree 3. Lines collapse reciprocal maps; horizontal loops and multiplicities are in the data exports.

Run 20261017. Sources: evidence/*-strata.json and *-stratum-edges.json. Exact counts; no statistical uncertainty.

Verified coverage: 24,823 vertices, 69,300 directed maps, 51 conductor strata. All selected-degree outgoing kernels and exact map identities replayed; all conductor populations agree. Original database hashes survived replay on copies. Independent implementation replay: NOT_RUN.

Maximum endomorphism conductors are 8192, 6561 and 1728. Floor-model inputs are included. Sources start at conductor 1. SQLite and CSV/JSONL exports contain the entire vertex class and all degree-2/3 maps in the stated sets. Every stratum has a representative with explicit outgoing rational maps. Arbitrary-degree maps are an infinite family, outside this finite export.

Evidence: evidence/coverage.json, **-build.json,** -verify.json, **-strata.json and** -stratum-edges.json. Exact integer census; uncertainty intervals do not apply. Protocol: PROTOCOL.md, commit 3b7f4b39c; frozen inputs/run commands: 946ab7419. Linux x86_64, 4 CPU quota, 16 GiB RAM. Construction/replay share native arithmetic. Conductor executable missing (127).

Still open: full A/C/D/E generation, independent implementation audit, graph-wide ECDLP min/max/mean and operation counts, direct EC index calculus, factor-base yield and finite-field reductions. No solver timings or speedup claims are made; IC scoreboards retain their prior performance values. Full report, exact inputs, commands, hashes and provenance accompany this PDF.
