Held-out χ resultant solves: five-arm native subset

Run: heldout-five-arm-v2 · **field:** `F_211^2` · **subgroup:** order 229 · **host:** Darwin arm64 shared L0.

All 60 children returned verified scalars. A separate Rust checker replayed both relation streams and all 332 relation witnesses. χ and direct pair had identical trials, relations, rank-nine recovery and scalars in all 12 paired rows. Mean cold S_group was 140.672 for χ, 88.908 for direct pair, 7.979 for signed rho and 4.361 for BSGS. The two-class floor is 0.886227.

The V1 setup ledger overcharged rho, BSGS and direct pair. V2 corrects it and retains V1. Source S3, quotient S3, direct inverse-Vélu and full image on these targets are still pending; portable primitive S and isolated wall are unset.
