Native interruption evidence

Both prescribed existing native logging controls completed once, one per frozen feature arm. This descriptive report awaits fresh independent supplemental review. Source admission remains withheld under DEC-20261016-5cf723. Scientific trials and new leaderboard scores: **zero**.

Arm	Passed / failed / filtered	Begin / end	OS wall	OS max RSS
Reference	1 / 0 / 85	2 / 0	0.03 s	2,850,816 B
Candidate	1 / 0 / 85	2 / 0	0.03 s	2,818,048 B

What ran. Only the named interruption unit test from each existing reference/candidate test executable. Each parent spawned its ignored Session/stage/sleep helper; it observed the flushed begin, then killed and waited for the child. Per-parent bound: 20 seconds plus five seconds kill grace. No build, arithmetic, construction, map replay, benchmark, extra native test or retry occurred.

Raw result. Each trace contains exactly total/begin and interruption_fixture_wait/begin. Each control records observed-before-kill=true, unfinished-stage-marked-complete=false and cryptographic_work=false. Native child_exit_code=null remains unchanged; the native schema does not measure the Unix signal. All 32 original native files, parent and child logs, exits, OS receipts, timestamps, argv and explicit environment whitelist are retained.

Cost scope. One parent per arm. The OS wall numbers are rounded; CPU and RSS are shared-host operational receipts for pure logging, with full counters in raw/ARM/os-time.txt. The diagram describes the logging contract because no cryptographic quantity was measured. No performance ratio or scientific memory-admission claim follows.

Provenance. Frozen source `015fa7bb504ef63953e0e04e464bb266f4f207bf`. Exact current unit hashes, sizes and feature/build/source links are in provenance-before.json and inputs/bindings.json. Unit hashes before/after and all four installed scientific executable hashes match. Current unit hashes bind these new invocations; historical invocation-time unit hashes were not retained. Old frozen015 interrupted raw remains absent.

Preservation and next review

Metadata correction, without native rerun. The first metadata inspector incorrectly required 128 filtered tests from an aggregate multi-executable suite count. These actual unit executables selected exactly one named test and filtered 85 others. Original metadata.py, control-check.json (INCOMPLETE) and logs remain unchanged. A separate raw-log-only checker independently verified every retained file/hash and required guard, then emitted control-check-v2.json (PASS). No native control was repeated. A later JavaScript packaging call failed parsing before any write or execution; metadata-attempts.md retains its exact diagnostic and cause.

Claim publication failure. The initial write-once claim push was rejected after the remote branch advanced. Raw stdout/stderr and exit 2 are retained. The Coordinator prescribed a normal merge of 40 published commits into the existing epoch1 claim. Its 129 incoming files did not change this goal's frozen territory. Merge b2d66d0022405a77707017b2aa5bab11af15842a preserved both parents; frozen-goal diff, hashes and scoped branch hygiene passed. Publishing the existing claim succeeded. No second claim epoch or prepublication native run occurred.

Custody. The complete raw/control/source-binding/report payload and its member hash/size manifest are in native-controls.tar.gz. Separate custody/ receipts record the authorized public raw archive transfer and full readback to `s3://crypto-autoresearcher/store`, logical suffix `015fa7bb504e/interruption-retake-v1`. Large unit executable payloads are excluded as required. The transport executable is byte-bound; its build-source provenance remains unestablished. Metadata inspection uses Python only for source/hash/log/archive handling; native execution uses the published shell/gtimeout/time command.

Prior review and root failure stay intact. Signed review06cc13 supports exact semantics but left resource/build/custody/default-policy inconclusive because historical trace retention was absent. This supplement records new evidence and does not rewrite that review. The complete root gate at3ce remains 4161 passed / 1 failed / 117 ignored, exit101. A later filtered14-test pass does not replace it. Test thresholds, source, defaults and challenge rules are unchanged.

Publication and authority. This is producer TASK-7b4402 for GOAL-ISOU-f30a07. Requested Executor policy/effort and unexposed actual model/effort are retained in provenance-before.json. Exact raw/source/feature/executable identities are separate from interpretation. Full details: report.md, raw-manifest.json, control-check-v2.json and metadata-correction.stdout.log.

Graphs checked. All 54 standard-prime leaderboard rows and canonical curve/cost graphs remain unchanged: no map or mathematical finding is produced. P192/50341 remains a constructed, unscored candidate requiring admitted complete replay. Historical board incumbents are unchanged.

Next action. Coordinator snapshot0b8b61; fresh independent review38a4d9 of the logging invocation/retention binding; then prospective decisionaea57d/archive409603. Source admission and scientific execution remain withheld until those actual gates. The producer assigns neither.
