Pursuing the ecbench leads

373 fresh public single-target attempts; 336 verified scalar recoveries. Outcomes: {'error': 1, 'exhausted': 36, 'verified': 336}.

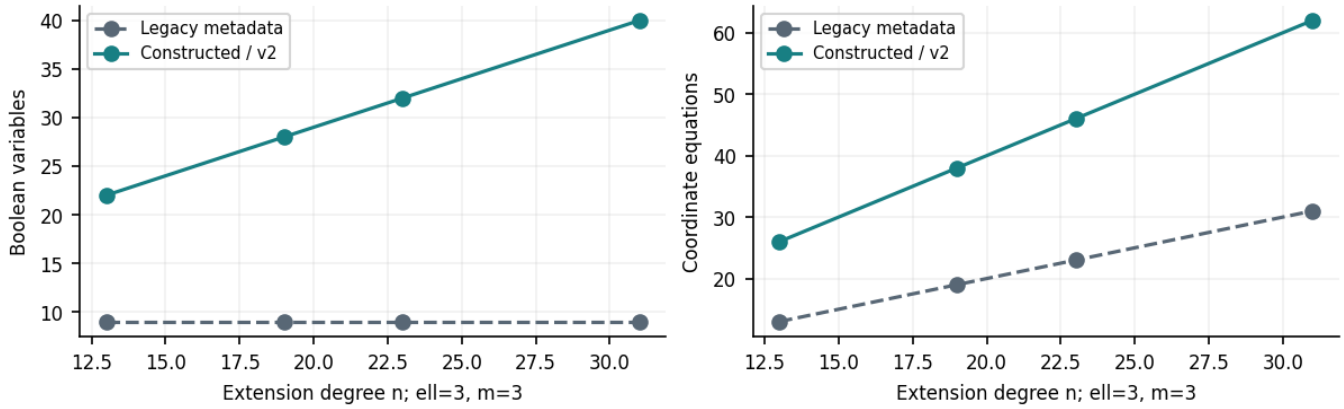

Both IC arms recovered all four held-out degree 37 public points, eight IC executions in total. Increasing the base from four to eight orbit columns changed mean counted S from 8.566326 to 2.618529; the four/eight count quotient is 3.271426. The eight-column/rho count quotient remains 9.012705. These are incomplete-cost diagnostics, not speedups.

The exact E0 degree 83 method now executes ordinary IC queries at both base sizes, but all four runs reached 256 queries without a point relation or rank gain. This discharges an implementation refusal; it does not pass the N83 target-recovery gate.

All session audits passed; unsuccessful deterministic outcomes replayed separately. The new method uses unknown factor-base logs and exact point witnesses at both integer widths. Versioned metadata includes all intermediate coordinates and equation blocks.

The exact E0 degree83 subgroup is retained. Bounded execution does not satisfy the N83 recovery gate. All ten mathematical questions remain partial. L0; no admitted wall time, fully priced speedup, asymptotic exponent or N131 transfer.

System shape: independently constructed inputs

ell=3, m=3. The plot uses native constructed counts and preserved legacy metadata; it is not a solving-degree or solver-cost claim.

Sources: PROTOCOL-v1.md; FINDINGS.md/findings.json; results.json; shape-controls.json; per-target.json; execution-manifest.json; parent literature/REPORT.md (29 references). The audit-reader amendment preserves the initial N83 reader failure and validates its correction against a pinned historical reader. See REPORT.md for source-linked run reports and exact remaining obligations.

Source-linked report and immutable evidence

Measured per-curve diagnostics

Verified-only means; ratios are missing on censored cells. Native work unpriced: these are count quotients, not full-cost ratios. Every target and failure remains in per-target.json.

Original questions and remaining gates

Q1. Prime-field base-size balance tested on fresh targets; scalable cheap decomposition/full cost open.

Q2. Actual chained metadata corrected and checked; solving-degree growth open.

Q3. Enumerated quotient witnesses lift exactly; compact algebraic correspondence open.

Q4. Parent nonlinear-base evidence retained; scalable membership/full cost open.

Q5. Parent quasi-subfield census retained; useful general family/full IC open.

Q6. Intermediate-variable accounting corrected; higher-arity solver/lifting advantage open.

Q7. Width-generic modular rank implemented; general useful-rank and descent law open.

Q8. Paid certified isogeny/Hecke transport open.

Q9. General norm and cheaper elliptic-component solver open.

Q10. Successful N83 recovery, full costs, isolated independent hardware and growing-size crossover open.

No new mathematical theorem. Native Rust sources and sealed records derive all values; this Python file only draws them and lays out the report. PR1853 remains subject to review and applicable CI. No research jobs continue after this completed local campaign.
