Run record: prime pair-table size

Session `ECBS1h382073f2a6ad` · **Spec** `ECS1h44eb950a013c` · **source commit** `2273c71ee1d3adddf47d4e6a2d75f06669d43739`

The precommitted spec ran the 20-bit prime curve `icv1-fp20-t727-cd198a38` (subgroup order 562427) on eight distinct public targets with seed 20261013. Three measured rounds followed one warmup. Each round ran rho.negation, the 32-abscissa pair table, the 64-abscissa pair table, and a rho A/A control with matched algorithm seed.

The runner recorded 128/128 executions as verified, with 24 measured executions per arm. No execution failed or timed out. The full audit replayed all 96 measured executions identically and reported zero problems. The run used macOS arm64 with 14 logical CPUs, `--cpus none` and `--allow-busy`; every wall observation earned L0.

ECBS1h382073f2a6ad · means from sealed records; prime native work remains unpriced; L0 wall

Arm	Mean GAE	Mean S	Measured verified
rho.negation	971.917	1.296	24/24
pair table B=32	22,094.250	29.461	24/24
pair table B=64	18,343.208	24.459	24/24
rho A/A	971.917	1.296	24/24

The harness's paired counted-cost comparison recorded B64/B32 = 0.830225 (95% target-cluster interval 0.697026–0.961546; 24 pairs). The matched rho comparison recorded B64/rho = 18.873. All four arms have unpriced native-work flags, and no wall comparison met the required L2 level.

Raw evidence: `../../sessions/prime20-b32-vs-b64/records.jsonl`, its sealed session files and saved comparisons; `../../replay-all.json`; `../../summary.json`. The graph source is `../../render_chart.mjs`. The PDF reports observations only; interpretation is in `../../REPORT.md`.
