Structural-completeness recount (sheriff case SHF-20261016-3caa6f)

The paper's "16 562 ordinary curve instances" matched no script output. Re-running the cited scripts (logs in this directory, `count.py`) gives the counts below. Every ordinary instance in the lemma's hypothesis class satisfies it (0 violations); the excluded class $r = \ell - 1$ always has $\ell \mid \#E^t$, as predicted. The CM-73 sweep processed the 330 primes $p \equiv 1 \pmod 6$, $7 \le p \le 5000$ (not 621).

ℓ	ordinary, hypothesis	ordinary, excluded	supersingular	total
3	5,250	0	10,938	16,188
5	315	0	3,096	3,411
7	2,591	578	1,708	4,877
11	198	0	0	198
13	1,510	94	0	1,604
all	9,864	672	15,742	26,278

blue: ordinary, hypothesis class; orange: ordinary, $r = \ell - 1$; grey: supersingular.
