Third paired run · 2026-10-13 01:59 UTC

The executable verified 48/48 solver arms and both explicit maps on the shared Darwin arm64 host. Its output schema failed: the TSV header has 47 fields and the rows have 48. The raw bytes, map log and identical same-host replay remain at `../../raw-v3.tsv`, `../../run-v3.log`, and `../../replay-v3.tsv`. SHA-256 of the raw TSV begins `77b7fa9f`.

No comparison is drawn from v3. The v4 runner checks its own header and row widths, then reruns every frozen target.
