Isomorphism and six-class control run v3

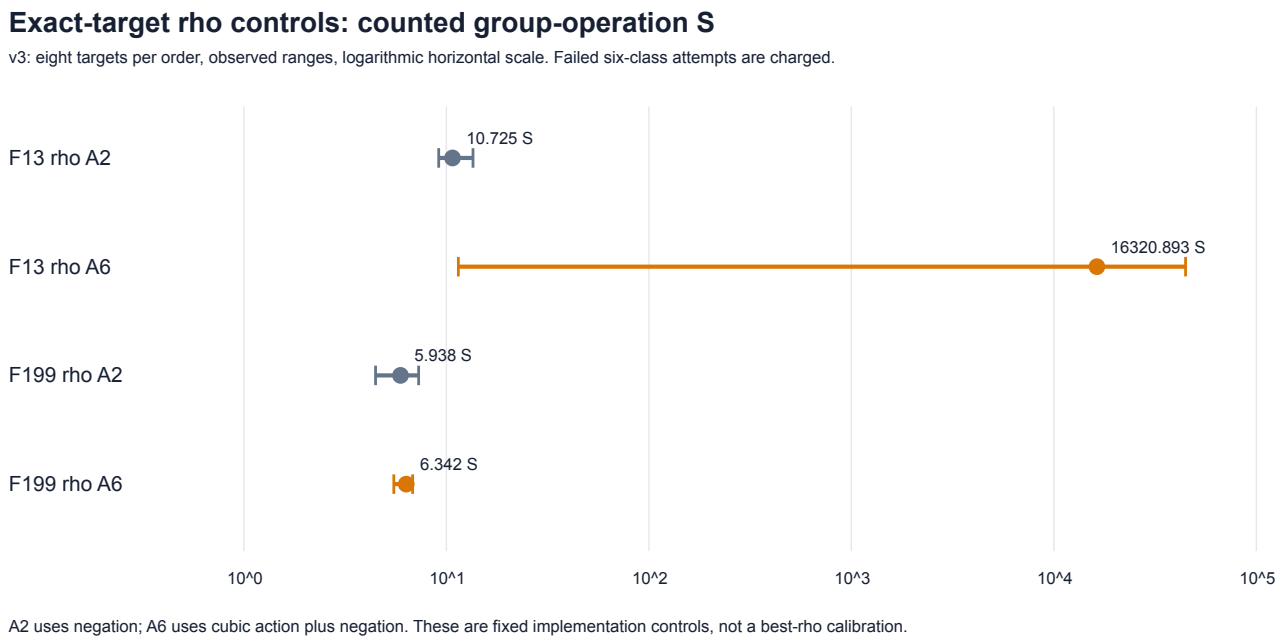

2026-10-13 16:34 UTC · shared Darwin arm64 · L0 · 80/80 verified

The v3 source and binary hashes, exact commands, 16 frozen source targets, per-attempt rho records, independent checker, and byte-identical replay are recorded in `README.md`. All 48 relation rows and 32 rho rows verified their source-target scalar. The graph reports counted group operations per sqrt(subgroup order), including destination source checks.

S = (group additions + doublings) / sqrt(r). Destination arms include source-point cross-verification; ratios use paired totals.

Rho control and phase accounting

Three F13 six-class targets needed a second attempt after a charged 100,000-operation first attempt. F199 six-class rho used one attempt per target. At order 211, degree-three and scaling-isomorphism relation collection took 359 and 358 trials over eight targets. The full phase table and raw records are `phase_summary-v3.tsv` and `raw-v3.tsv`. Map field work, square roots, lookups, row arithmetic, rho hashes and memory remain outside the graph's counted group-operation unit. The result report `REPORT.md` states the exact ratios and interpretation.
