V2 pairing-transfer run receipt

2026-10-15 05:55:25–05:55:32 UTC · shared Darwin 25.6.0 arm64 · L0

The committed run source was `b4e2bff9cb753bf8412e62c1a7e090ceb56e27f8`. Source SHA-256: `382ea60f8746c5145ebffe6d25f6809a520b09974f9f5e294da9d96b96d82de7`. `../../FREEZE_V2.md` pins the public inputs, selected pairing points, binary, and preregistered V2 schedule. `../../RUN_V2.sh` exited zero after 30 commands; all stderr files are empty. Each of the two public subgroup cells had three rounds of exact pairing, separate source-scalar replay, three pairing checks, negation rho, and rho A/A. Pairing scalars 12 and 10 passed all six independent $[k]G = Q$ checks; all 18 pairing checks and 12 rho controls passed.

(p, r)	Full pairing CPU	Rho CPU	Paired ratio
$(61, 19)$	108.490 ms	39.000 µs	2,781.81×
$(271, 61)$	25.681 ms	35.250 µs	698.15×

Values are three-round medians. Each paired ratio was computed within its round before taking the median; the Markdown report gives min–max ranges.

Source: `SUMMARY_V2.json` derived from 30 native raw commands in `runs_v2/`, commit `b4e2bff9cb`. Rho A/A and all six independent scalar replays passed. The min–max interval is a three-run range, not a confidence interval. CPU ratios on this shared host are descriptive.

The graph source is `../../GRAPH_V2.typ`, using `../../SUMMARY_V2.json` and 30 raw command records under `../../runs_v2/`. In the selection phase, candidate search used 26,469 of 27,169 extension multiplications at $p = 61$, and 39,115 of 39,673 at $p = 271$. Miller and final exponentiation are metered separately. The full total includes cold work, scalar replay, and the three extra pairing checks; process peak RSS was 6.57–6.64 MB. V1 bytes under `../../runs/` remain preserved with their own run report.

CPU excludes input parsing, output serialization and calibration. The three-round range is descriptive; this shared-host L0 receipt does not establish isolated wall performance or scaling.
