Eigen-Séta v2 L1 KEM round-trip record

Run `run-20261011T1955Z-final-l1`, protocol frozen 2026-10-11 19:55 UTC. Source: repository commit `cd47963f9` imported into base `7f7672d01`, with the scalar-recovery and bounded public-input validation edits. This run preceded the later explicit 3-power membership check and PKE layer.

Command from `eigen_seta/`: `cargo run --release --example run -- L1 1`. Rust 1.99.0, release build, AMD EPYC 7763 shared cloud VM, x86-64 and five logical CPUs. No core pinning, isolation or frequency control. `OsRng` seed not captured. Requested and completed: one key and one KEM round trip. Exit 0; shared keys equal. No failures.

KeyGen (s)	Encaps (s)	Decaps (s)
31.050	0.3032	11.464

Each value is a measured wall-clock sample (n=1); no spread or uncertainty interval was recorded. Public key and KEM ciphertext: 1344 bytes each. Sampled secret degree: 277 bits. Exact output: `records/run_output.txt`.

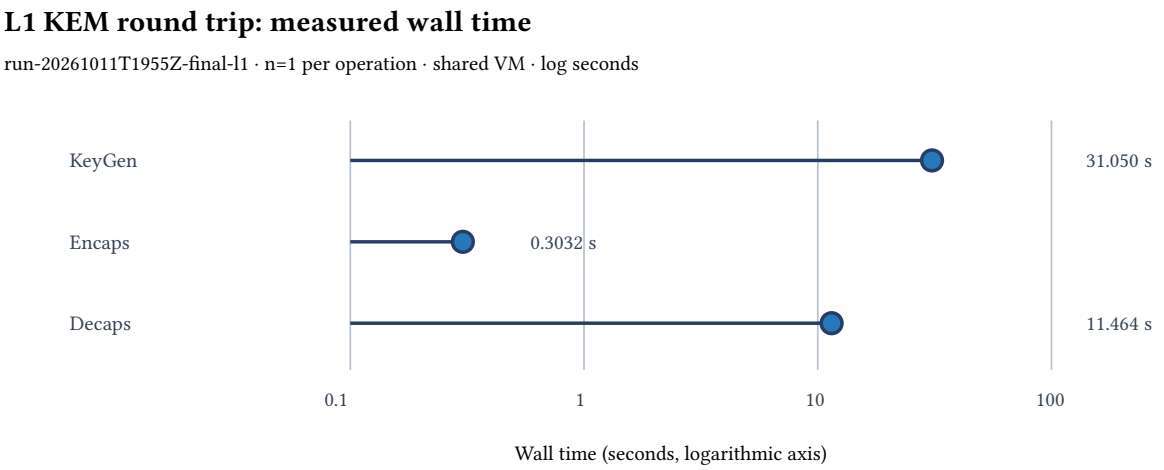

Figure 1: Wall times, one sample per operation, log seconds. Run run-20261011T1955Z-final-l1.

This result demonstrates one functional round trip, not security, constant-time behavior or a comparative performance conclusion.
