Run report: d4_weighted_s5 cells, 2026-10-15 06:38Z–07:43Z

Command and build. `raw/run_all.sh`, the cells of `PROTOCOL.md` §3, in order. The binary is `examples/d4_weighted_s5` built at commit `87fe78b63` (`raw/binary_commit.txt`).

Host and isolation. Claude Code cloud container, 4 vCPU Xeon, shared with four other lanes. Isolation level L0. Each run used one thread (`RAYON_NUM_THREADS=1`), `nice 10` and `prlimit --as` 2.5 GB.

Runs requested and completed.

requested	completed
controls: 2 invariance checks and 9 generic systems	11 / 11
tiny cells: $p \in \{13, 17, 29, 37\}$, 6 targets each, arms w and c8, brute force and MITM	24 / 24
measured cells: $p \in \{269, 1033, 4093\}$, 8 targets each, arms w and c8, MITM	24 / 24
w-only cells: same p, seed 2, 12 targets each	36 / 36

Failures. At $p = 17$, target 4, the quotient has dimension 514. Both arms report it unsolved ("border unreachable at this degree"), and brute force finds 4 decompositions there. No crash, timeout or out-of-memory event occurred.

Values (measured). Unit: F_p multiplications per solve.

- Arm w: median 1.41–$1.44 \cdot 10^9$ at $p = 269$, 1033 and 4093.
- C8: median 2.54–$2.56 \cdot 10^{10}$.
- Paired ratio: medians 17.8–18.2, minimum 7.7.
- Lift-back: at most $2.8 \cdot 10^5$.

Full tables are in `summary.txt` and `README.md`. Raw records are `raw/{controls,tiny,measured,w_only}.jsonl` and their `.log` files.

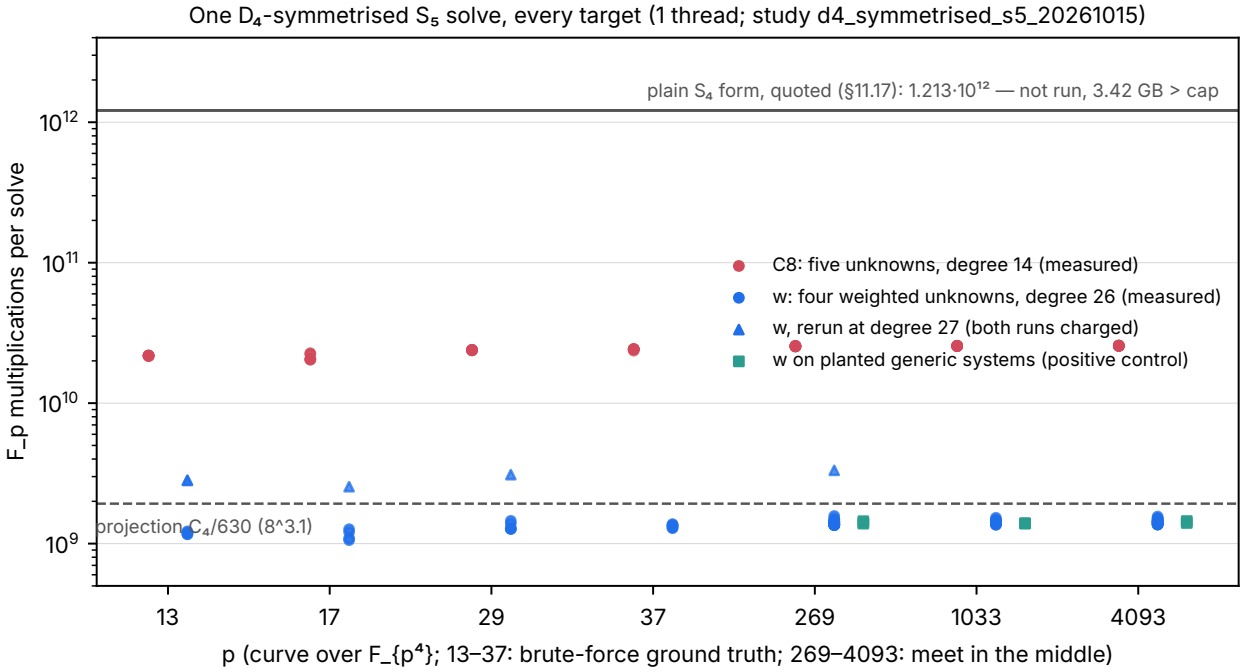

Figure 1: Every target's cost, both arms. Run window 06:38Z–07:43Z.
