First paired run · 2026-10-13 01:46 UTC

48/48 arm answers and both exact maps verified. Shared Darwin arm64 host, L0. The frozen inputs and command are in `README.md`; raw record SHA-256 begins `cf76dc61`. This run placed the whole rho ledger under `setup_gae`, so its phase label is incorrect. Group-operation totals and replayed answers remain readable. v4 is the accounting reference.

The chart shows counted group-operation S, mean and observed range over eight public targets per field. Map field work, roots, lookups, and row arithmetic are not converted into this unit. See `../../raw.tsv` and the final `REPORT.md`.
