Second paired run · 2026-10-13 01:56 UTC

48/48 arm answers and both exact maps verified. Shared Darwin arm64 host, L0. The frozen inputs and command are in `README.md`; raw record SHA-256 begins `bdfaafb5`. Rho's phase is separated, but a reported zero for its table lookups was only a placeholder: the library does not expose that count. v4 removes the misleading column.

The chart shows counted group-operation S, mean and observed range over eight public targets per field. Native map, lookup, root and row work remains separate. See `../../raw-v2.tsv` and the final `REPORT.md`.
