Final paired run · 2026-10-13 02:00 UTC

16 public source targets, three arms each: 48/48 verified answers. The degree-three maps passed 361 and 44,521 ordered-pair checks. Frozen protocol `../../PROTOCOL.md`; raw/replay SHA-256 begins `995b7bcc`. Shared Darwin arm64 host, L0. All 47 TSV fields match each row. The replay and map logs compare byte for byte on the same host. An independent-code native point-law verifier passed all 48 rows and rechecked the four curve orders and the cubic automorphism on 89,764 ordered point pairs. The later structural audit checked scaling isomorphisms on 44,882 ordered pairs; receipt in `../../validation/`.

Mean counted-group S at order 211: rho 5.938; source relations 50.186; transported relations 41.332. Eight targets per arm; whiskers are observed minima and maxima. Map field work, roots, lookups and row arithmetic remain unpriced in S. The phase table is `../../phase_summary-v4.tsv`; the full interpretation and next admission test are in `../../REPORT.md`.
