support-squarefree-cost-manyfields-20261016-v1

Historical Python provenance; source and input identities are pinned by TRANSPORT.json and the two frozen SOURCE_MANIFEST.json files. This PR introduces no new solver measurements.

Host: managed Linux x86_64 cloud worker, one CPU and 4 GiB worker budget. Qualified uncontended isolation, A/A control and independent external review were not established. Values are descriptive; no confidence interval was recorded.

All three frozen workers passed. Source snapshots and raw stdout/stderr/process/preregistration/result records are preserved byte-for-byte after gzip decoding. The full older journal is identified by digest but not bundled; this is not a complete resumable lab history.

Command and accounting: see historical/lab/ledger/attempts/support-squarefree-cost-manyfields-20261016-v1/0001/preregistration.json and process.json. Seeds, field parameters, exact command arrays and deadline boundaries remain frozen there.
