# Eigen-Séta v2 L1 plaintext-encryption record

Run `run-20261011T1956Z-pke-l1`, protocol frozen 2026-10-11 19:56 UTC. Source: same-repository commit `cd47963f9` imported into base `7f7672d01`, with the scalar-recovery fix, public-input validation, and ChaCha20-Poly1305 KEM–DEM PKE layer.

Command from `eigen_seta/`: `cargo run --release --example pke_run -- L1`. Rust 1.99.0, release build, AMD EPYC 7763 shared cloud VM, x86-64 and five logical CPUs. No core pinning, isolation or frequency control. `OsRng` seed not captured. Requested and completed: one key and one 39-byte message encryption/decryption with fixed associated data. Exit 0, plaintexts equal. No failures.

| KeyGen (s) | Encrypt (s) | Decrypt (s) |
|---|---|---|
| 25.044 | 0.3897 | 11.208 |

Each value is a measured wall-clock sample (n=1); no spread or uncertainty interval was recorded. Public key: 1344 bytes. Complete PKE ciphertext: 1411 bytes, including the KEM ciphertext, nonce and authentication tag. Exact output: `records/run_output.txt`.

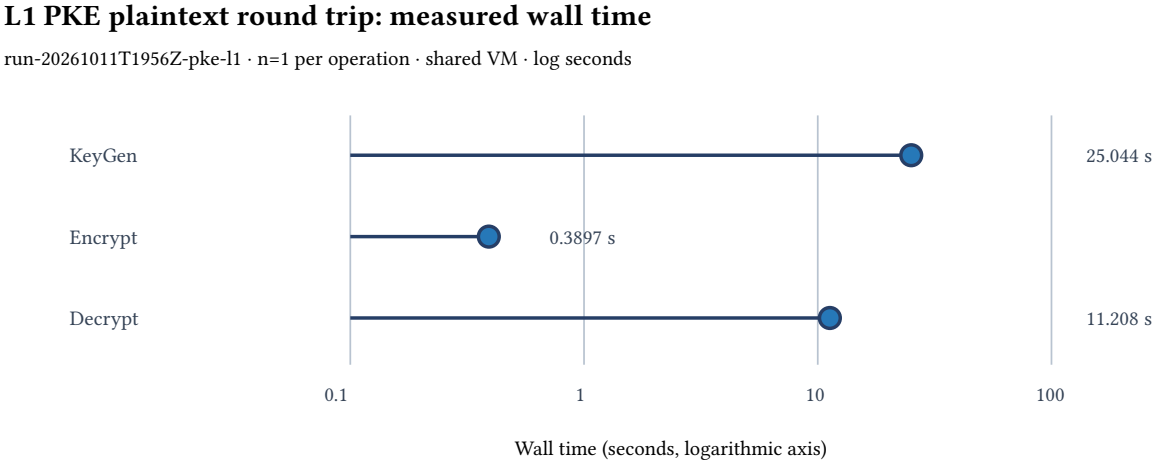

Figure 1: Wall times, one sample per operation, log seconds. Run run-20261011T1956Z-pke-l1.

This result demonstrates one authenticated plaintext round trip, not a security, constant-time or comparative-performance conclusion.
