Run report: run-20261017T1623Z-pk-degree-test

Observations only. eigenx commit `94fe2d9`; shared 4-vCPU Xeon @ 2.10 GHz VM, rustc 1.97.0, no pinning (L0).

Command. `pk_degree_test L1 100 7 1, L3 30 3 0, L5 15 3 0`. Per set: one fresh key; the true degree; wrong candidates (uniform, and near misses agreeing on 16, 64 or $\lfloor f_bits/2 \rfloor$ low bits); interleaved timing of one public-key test (theta chain) against one decapsulation. A Lean install and compile overlapped some L1 timing repetitions.

set	E	e (true f)	wrong tested / accepted	test s, median [range]	decaps s, median [range]	reps
L1	1076	569	105 / 0	0.79 [0.53–0.91]	1.28 [1.11–1.57]	7
L3	1594	832	35 / 0	2.72 [2.64–2.78]	5.54 [5.49–5.75]	3
L5	2106	1087	18 / 0	6.84 [6.66–7.03]	13.34 [11.54–14.26]	3

Structural inspection at L1: true f glued, 563 Richelot steps, split at the end; one wrong f glued, 566 steps, no early split, no final split. No failures, panics or timeouts; every decapsulation correct.

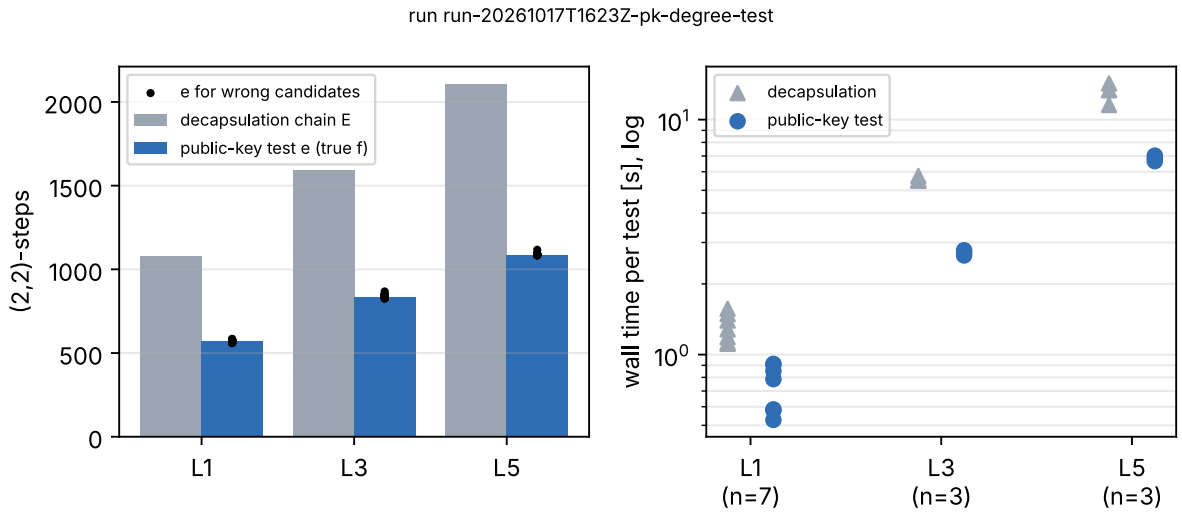

Figure 1: Measured; records in `research/eigen_seta_assessment_20261017/records/run-20261017T1623Z-pk-degree-test/`.
