Root-finding pair-table size: prime 20-bit cohort

Measured configuration comparison. The frozen protocol and spec were committed at `2273c71ee1d3adddf47d4e6a2d75f06669d43739` before the session. The curve is `icv1-fp20-t727-cd198a38` with subgroup order 562427. Both IC arms use the same two-summand negation-folded pair-table oracle, full-rank checked matrix policy, public targets, and algorithm seeds. Only the number of prime abscissae differs: 32 versus 64.

Arm	Verified	Mean GAE	Mean S	Trials
rho.negation	24/24	971.917	1.296	—
pair table B=32	24/24	22,094.250	29.461	18,394
pair table B=64	24/24	18,343.208	24.459	10,641

ECBS1h382073f2a6ad · means from sealed records; prime native work remains unpriced; L0 wall

The paired counted-cost quotient B64/B32 is **0.830225** (95% target-cluster interval **0.697026–0.961546**, 24 pairs from eight targets). This is a 1.204492 baseline/candidate quotient in ecbench.gae. B64 added 3,104 setup and 812 verification GAE on average, saved 7,667 relation GAE, and reduced the cold counted total by 3,751 GAE. Six of eight target means favored B64.

The matched rho arm averaged 971.917 GAE; B64/rho is 18.873 in the paired comparison. The rho A/A operation quotient is exactly 1.000. All 128 planned executions verified, and all 96 measured executions replayed with identical outputs (receipt `cdd1a0bcde5fca4939b912688f20ab662f53b3557197c742f3f01788b8135c58`).

Boundary. Prime factor-base lifts, square roots, Legendre tests, hash lookups, target probes and row operations are unpriced in GAE. Every run earned L0 wall only; no wall result is admitted. The measured quotient is a counted lower-bound operation comparison, not a complete-cost runtime claim. Whole-process RSS maxima do not measure isolated table memory.

Evidence. Session `ECBS1h382073f2a6ad`; spec `ECS1h44eb950a013c`; binary SHA-256 `be956553a5a2cd1227e8f1add8dd24e11dffba5068c799234b55e44ffc3a1b61`. Raw records and comparisons: `sessions/prime20-b32-vs-b64/`. Figure source: `render_chart.mjs` and `summary.json`. Detailed limits and commands: `REPORT.md`. No canonical frontier graph changed because this local L0 session has unpriced native work and lacks independent-host replay.
