Selected p=211 full rational-fiber audit

2026-10-15 · native Rust · Darwin arm64, macOS 26.6 · shared L0 host. The protocol and exact runner/checker source, binary and script hashes were committed before execution. The field is F_211[s]/(s²−2), the source is $y^2=x^3-21x+37$, and the explicit degree-three destination is $y^2=x^3-81x-243$. Their j values are 77 and 160.

Audited quantity	Runner	Independent checker
Source points enumerated	44,655	44,655
Distinct image points	14,885	14,885
Three-point rational fibers	14,885 / 14,885	14,885 / 14,885
Order-229 subgroup pairs	52,441 / 52,441	52,441 / 52,441
Peak RSS, bytes	22,315,008	21,102,592

The identity fiber is exactly {O,(3,1),(3,−1)}. Cofactor projection selected G=((170,0),(0,109)) and mapped it to G′=((76,0),(0,69)); both have exact order 229. Both implementations reproduced full-map digest **7abd68e5b21e76ec** and subgroup-map digest **1287b41a3eb687c1**. Both exited zero with empty stderr within the frozen 120-second and 512 MiB ceilings.

Evidence: FIBER_SPEC_V1.json, FIBER_V1.json, FIBER_REPLAY_V1.json, FIBER_SUMMARY_V1.json and FIBER_REPORT.md in this directory. The report links the full digests, commands, scripts, exits and checker. This is a finite map/fiber correctness result. Relation solves, scalar recovery, complete counted S and matched direct BSGS/rho at order 229 are pending. The canonical ECDLP frontier is unchanged.
