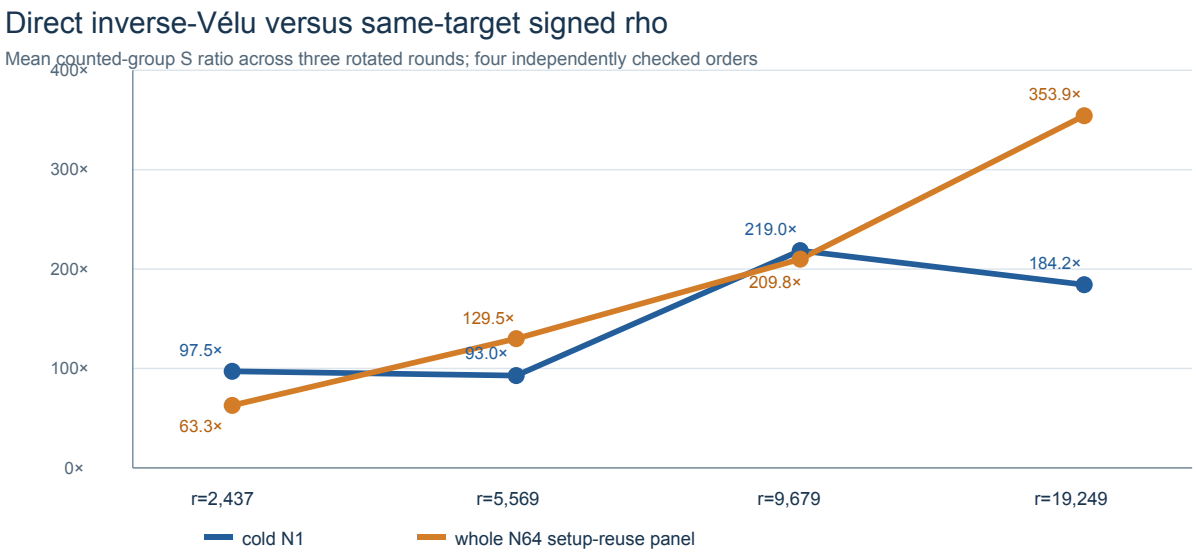
Four-order direct inverse-Vélu trend

Run: inverse_velu/trend_four_cell_v1/darwin_v1 · **host:** Darwin arm64 shared L0



Source: TREND_DARWIN_V1.summary.json, 96 raw children, four separate Rust checker receipts. Group-only diagnostic; portable S unset.

All 96 planned native children completed: four subgroup orders, four arms, N1 and N64, three rotated rounds. A separate Rust checker replayed 3,120 scalars and 9,565 relation witnesses. Cold N1 inverse/rho counted-group ratios were 97.505, 92.994, 218.951, 184.163; whole N64 ratios were 63.337, 129.521, 209.787, 353.855. This is a counted-group lower-bound comparison. The two-class floor is S_group=0.886227; complete portable S is unset.

The full-image census has not run under an enforceable 512 MiB cap on these cells. Linux order-1201 replay and L2 isolated wall admission remain pending. Sources: TREND_RUN_SPEC_V1.json, TREND_DARWIN_V1.summary.json, four independent checker receipts, darwin_v1/ and DARWIN_V1.artifacts.sha256.
