Extended structural controls

Frozen protocol v1 plus structural/replay amendments v2/v3. Receipt: controls-v3.json. These are construction, algebraic and functional checks; no timing or full-cost comparison was made.

Quasi-subfield census

Every retained witness was checked by independent root enumeration. Zero results apply only to the specified coefficient domain.

Nonlinear bases, degree profiles and QUBO

Six gamma-weight bases passed membership/order/orbit coefficient checks. Macaulay rank profiles are recorded through degree 5 at small dimensions; they are not a solving-degree theorem. All 8,192 original QUBO assignments passed faithful completion checks. No annealer or quantum hardware ran.

Actual covers and functional recovery

Degree 7 and degree 83 E0/E1 divisor pullbacks passed checked arithmetic controls. The degree 7 public point recovered scalar 6 through generic Jacobian BSGS and verified on both groups. No measured speed claim follows. General norm and a cheaper destination IC remain open.

The E1 cofactor-two constructor failure and first replay-checker identity failure are preserved, with explicit corrections. F101 genus-2 certificate replay passed; its two-infinity Jacobian backend is unsupported.
